

DERMAGLOVE

PROTECTING YOUR SKIN  
& THE ENVIRONMENT

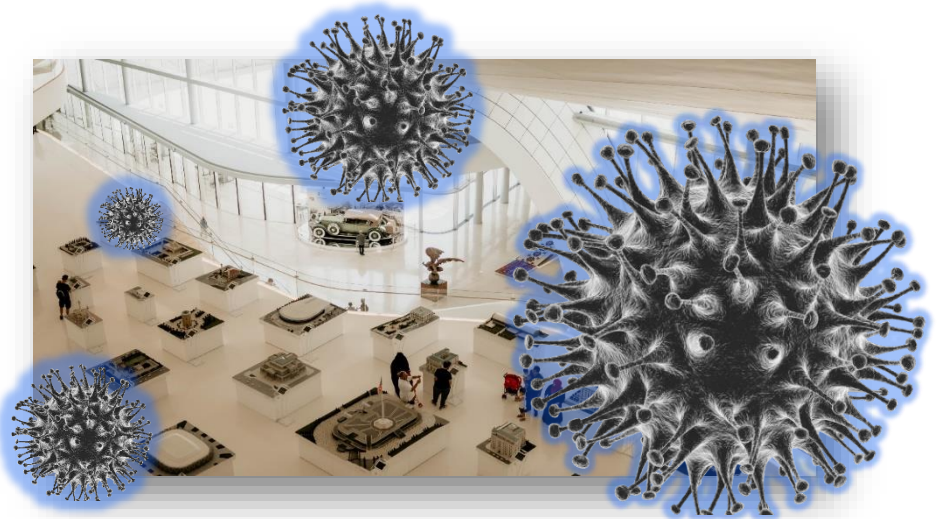

## FOG REMEDIATION DISINFECTING PROCESS

With the surge in COVID-19 cases, it is critically important to protect your environment as well as the occupants therein. Take the extra step to ensure your office remains clean, healthy, and safe. Most facilities look clean. However, commonly touched surfaces could be harboring germs if not disinfected. Therefore, the implementation of processes and procedures to control dangerous microbes should be a top priority.

Secondly, killing germs before they move between workers, building occupants and visitors is essential. Reducing the risk of disease transmission on the job means taking a new approach to cleaning with a greater emphasis on disinfection.

### WE RECOMMEND A 2-STEP FOG REMEDIATION DISINFECTING PROCESS

**Step One:** Our state-of-the art fog disinfectant process will give you comfort in knowing that your space is safe. We incorporate the use of a plant-based disinfection formula known as **THYME 2 KILL** to physically eradicate germs, toxins and contaminants from all surfaces, including and not limited to ceiling, fixtures, floors, walls, and all other high-touch areas.

**Step Two:** Daily protection is key in preserving the cleanliness of your environment. Use **DERMAGLOVE MULTI-SURFACE HYGENIC WIPES** to kill 99.99% of toxins, germs and bacteria while continuing to build a barrier of protection on surfaces. Many of you are familiar with the DERMAGLOVE brand by using our hand sanitizing stations. However, DERMAGLOVE has created an entire line of wipes that not only protects the skin but surfaces as well.
